Magna D.O.P. Series

Features.

The Magna D.O.P. Series, High Efficiency Particulate Air Filter/HEPA, is designed to meet exact specifications in high efficiency applications. The Magna D.O.P. Series combines state-of-the-art construction techniques with superior reliability to offer maximum value for commercial and industrial applications. The Magna D.O.P. Series is produced in a wide range of efficiencies, sizes, frame types and header combinations that make it a perfect filter for converting or upgrading existing systems.

Construction.

Magna D.O.P. Series filters are manufactured with high efficiency glass microfiber media that is gently pleated to form the media pack. Rolled edge aluminum separators are inserted between each pleat to provide extensive open-area for airflow and to stabilize the media pack. A heavy duty galvanized steel frame or fire retardant particle board frame will encapsulate the media pack. The entire media pack is completely bonded inside the filter frame on all four sides by means of a self-extinguishing adhesive which prevents air bypass around the media pack. The filter shall have an external gasket applied to the frame if necessary. As an option, the D.O.P. filter shall be tested for efficiency on near-monodispersed .30 micron size particles. Each filter is carefully packaged into a heavy duty carton with a separate inner-liner for added protection during transit.

Applications.

The Magna D.O.P. Series filters are designed for use where a high degree of cleanliness is required and contaminants must be removed to protect life, products or building interiors. The filters are used in a variety of applications such as: hospitals, manufacturing plants, microelectronic component assembly, negative air machines, biological hoods and food processing.
